Valium® (generic name: **diazepam**) is a prescription medication in the benzodiazepine class. Healthcare providers may prescribe it to treat anxiety disorders, certain seizure disorders, muscle spasms, and symptoms of alcohol withdrawal. Because diazepam can cause dependence, misuse, and withdrawal symptoms, it should only be used under the supervision of a licensed healthcare professional.

What Is Valium?

Diazepam works by enhancing the effects of gamma-aminobutyric acid (GABA), a neurotransmitter that helps reduce excessive activity in the brain and central nervous system. It is prescribed only after a clinician evaluates whether the potential benefits outweigh the risks for an individual patient.

How Is Valium Prescribed?

In many countries, including the United States, diazepam is available only with a valid prescription. A healthcare provider will assess your medical history, current medications, symptoms, and other relevant factors before determining whether diazepam is appropriate.

Depending on applicable laws and regulations, some consultations may be available through licensed telehealth services. If a prescription is issued, it should be filled through a licensed pharmacy.

Choosing a Licensed Pharmacy

If you fill a prescription online, choose a pharmacy that:

- Requires a valid prescription where required by law.
- Employs licensed pharmacists.
- Clearly displays licensing and contact information.
- Uses secure systems to protect personal information.
- Provides access to medication counseling.

Avoid websites that advertise prescription medications without proper medical evaluation or make unrealistic claims.

Important Safety Information

Before taking diazepam, tell your healthcare provider if you:

- Have breathing disorders.
- Have liver disease.
- Have a history of substance use disorder.
- Are pregnant or breastfeeding.
- Take opioids, alcohol, or other medications that may increase sedation.

Take diazepam exactly as prescribed. Do not stop taking it suddenly without medical guidance, as withdrawal symptoms can occur.

Possible Side Effects

Common side effects include:

- Drowsiness
- Fatigue
- Dizziness
- Muscle weakness
- Impaired coordination

Seek emergency medical attention if you experience slowed breathing, severe allergic reactions, or other serious symptoms.
